Conclusion

INTRODUCTION

An action committed or omitted, which constitutes an offense and is punishable by law, is a crime. Crime is a highly complex phenomenon that changes across cultures and across time. Several types of crime exist such as crimes against persons, crimes against property, organized crime, occupational crimes, and political crimes. **Crime, while condemned, has an undeniable presence in society.**

In a recent report by the World of Statistics, **India ranked 77th on the World's Most Criminal Countries list.** Article 21 of the Indian Constitution provides for the Right to Life and the Right to Personal Liberty as fundamental rights.

Crime hampers the socio-economic and political development of society. It lowers the quality of living and increases the cost of living in communities. Crime against individuals, institutions, and communities disrupts order and social norms. The concern with crime is well justified given its pernicious effects on economic activity.

The causes of crime lie in social processes and structures. However, **correlations can be made about the interplay of social, economic, demographic, local, and institutional factors.** For this study, we have analyzed the socio-economic, criminal, and infrastructural factors affecting the propensity of crime committed state-wise. A thorough trend analysis has been conducted to arrive at a crime rate index and ranking for Indian states.

METHODOLOGY

The following strategy was used to arrive at the final index -:

1) Various indicators were identified that impacted the security of a particular region. **These indicators were then segregated into factors (Economic, Social, Infrastructure, and Criminality) based on their nature.**

2) Now to ensure that the raw data collected from various sources is free from any bias, **normalisation was done on the data set using the unitary method.**

3) To bridge the gaps between the datasets of 2001, 2011 and 2021, the forecasting technique was followed in MS Excel, which **bridged the gap with a confidence interval of 95%.**

3) This raw data was then used to construct indexes of each particular indicator, ranking each state based on the nature of the Indicators. To construct these small indexes, **Principal Component Analysis or PCA approach was followed.**

4) Upon the usage of PCA, **varimax rotation** was followed to ensure the reliability of the data.

5) These small indexes were then combined to arrive at a single **National Security Index using PCA analysis.** PCA analysis was done to ensure that in the final index, all the indicators have an equal role or value to play.

PARAMETERS

Social Indicators

Criminal behaviour is a social phenomenon that is affected by several societal factors. For the purpose of our research, we have chosen the following four social indicators to analyze the demographic composition of states and correlate them with criminal tendencies:

1. **Literacy Rate**
2. **Sex Ratio**
3. **Population Density**
4. **Birth Rate**

The following assumptions have been made:

The **literacy rate** is an important variable that may help in determining the crime rate of a state. It is assumed that more the literacy rate of a state, the less the crime would be. As the literacy rate of the state increases, awareness rises and there are fewer unemployed people therefore they will not opt for illegal ways to get money.

There have been previous studies on **uneven sex ratio** and rising violence. Murder rates in India are often correlated with the gender ratio. One plausible explanation is that low female-male ratios and high murder rates are joint symptoms of a patriarchal environment. This study also suggests that gender relations, in general, have a crucial bearing on criminal violence.

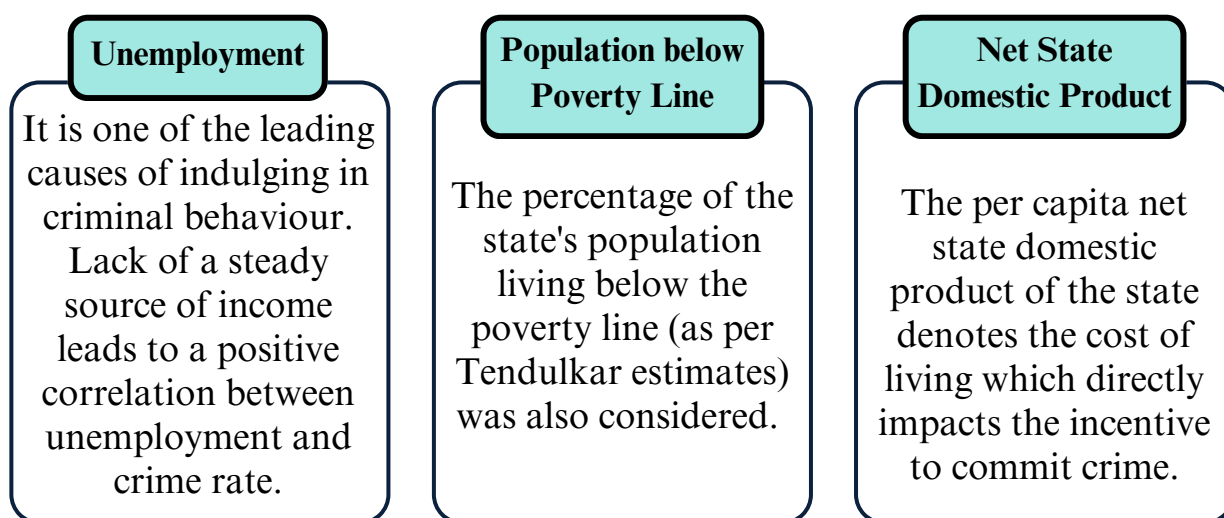

The **population density and birth rate** have also been considered. The assumption is that there exists a positive relation between these indicators and crime, ie, as the population increases, crime also increases.

Economic Indicators

According to economic theory, crime decreases as economic growth and opportunity improve. That's because the incentive to engage in illegal activity decreases as legal avenues of earning income become more fruitful. Therefore with the rise in the economic welfare of communities, the crime rate decreases.

For this study, we have chosen the following parameters:

1. **Unemployment rate**
2. **Population living below the poverty line**
3. **Per capita net state domestic product.**

Infrastructure Indicators

As per our research, it is noticed that the modernisation of the police workforce along with large-scale recruitments and training, an improvement in infrastructure and efficient coordination have led to the continuous improvement in the law and order situation and have strengthened the sense of security among all the sections of the society.

For this purpose, four parameters have been taken under this indicator namely **population per police station, police personnel per lakh people, police stations per sq km, and transport facility.**

Poor infrastructure can create an environment that is conducive to criminal activities.

Population per police station reveals the number of people that comes under its jurisdiction whereas the police personnel per lakh people indicates the number of police workforce available per population. This is necessary to check whether the police infrastructure is well equipped to cater to the needs of the population across various states considering the fact that India's ratio of police to population is very low.

Police stations per sq km reveal the level of accessibility in a given area and ensure better coverage of law enforcement services.

Police transport facilities refer to the vehicles and types of equipment that police officers use for transportation to respond to emergencies, patrol areas and transport individuals in custody. Having a sufficient number of these facilities is important for ensuring the safety of both the police officers and the public.

Criminality Indicators

Criminality indicators provide insights into the prevalence of criminal activity within a particular jurisdiction or population. These indicators are often used by **law enforcement and criminal justice professionals** to determine the different types of crimes committed or track the trends in crimes over the years.

In our research, a high crime index with respect to criminality indicators using PCA is considered to have high crimes committed in that state/UT and vice versa.

STATISTICAL TESTS

In order to ensure that our findings are statistically correct and relevant, we performed the following test

Normalization of data

Data normalization is a technique used in data mining to transform the values of a data set into a common scale. This is because many machine learning algorithms are sensitive to the scale of the input features and can produce better results when the data is normalized.

There are various techniques for normalizing the data but max-min normalization is being used in this index.

Min-Max normalization is one of the most common ways to normalize the data. For every feature, the minimum value gets transformed to zero and the maximum value gets transformed to 1 and every other value gets transformed into a decimal between zero and one.

For Example

If the minimum value of the feature is 20 and the maximum value is 40, then the value 30 would be transformed to about 0.5 since it is halfway between 20 and 40.

$$\frac{\text{MAX VALUE} - \text{VALUE}}{\text{MAX VALUE} - \text{MIN VALUE}} = \frac{40 - 30}{40 - 20} = \frac{10}{20} = 0.5$$

It guarantees all the features will have the exact same scale but does not handle outliers well.

Principal Component Analysis (PCA)

PCA is a statistical method that analyzes large datasets containing a high number of dimensions/features per observation, increasing the interpretability of data while preserving the maximum amount of information, and enabling the visualization of multidimensional data.

This is accomplished by linearly transforming the data into a new coordinate system where (most of) the variation in the data can be described with fewer dimensions than the initial data. Many studies use the first two principal components in order to plot the data in two dimensions and to visually identify **clusters of closely related data points**.

CONCLUSION

This study focuses on the prevailing crime rate in India including all its states and union territories. It can be concluded that Jharkhand has the highest crime rate with the 35th rank in all the states and union territories whereas Kerala has least crime rate with the 1st rank in all the states and union territories.

The analysis reflects a reasonably strong relationship between economic indicators, social indicators, infrastructure indicators, and per capita crime under IPC in India.

Crime has existed in all societies, and efforts to legislate, enforce, punish, or otherwise correct criminal behaviour have not succeeded in eliminating crime. While some have concluded that crime is a necessary evil in human society, and have sought to justify its existence by pointing to its role in social change, an alternative view is that the cause of crime is to be found in the problems of human nature and human relationships that have plagued us since the origins of human society. Correcting these problems would effectively remove the source of crime, and bring about a peaceful world where all people could realize their potential as individuals, and develop satisfying, harmonious relationships with others.

The criminal justice system is the system that controls the functioning of institutions like the police, prisons, courts, etc., that work towards granting justice to the victim. The state must maintain peace and harmony in society, and this can only be achieved with the proper implementation of laws and the

efficient criminal justice system of a country. The criminal laws in India were majorly enacted by the British East India Company, but after a lot of amendments were made to the laws.

With the advancements of time and technology, new crimes like organized crimes, white collar crimes, cyber crimes, etc., are increasing, and the government feels the need to reform the justice system to deal with such offenses. As a result of this, various committees set up by the government gave various suggestions and recommendations. But still, the condition has not improved. Courts are still suffering from pressure due to the pendency of cases, which is a result of the shortage of judges. It is perceived by the public that the police force is under the influence of politicians, and corruption has made them ineffective in fulfilling their duties. Instances of custodian rapes and death are increasing day by day. This creates fear in the minds of the public. Prisons witness a situation of overcrowding and prisoners suffer from inhuman and degrading treatment. The recommendations of various committees are on the paper but not implemented properly. There is a need to solve all the issues and fill the gaps in the criminal justice system in India in order to provide fair justice.
